2 Assistant Professor, Master Of Computer Application, East West Institute Of Technology, Bangalore, Karnataka, India

Abstract
Each educational establishment nowadays is competing to show that they are the finest at providing education at all levels. These institutes are implementing a variety of cutting-edge technology in an effort to attract more students to their universities. One of the several technologies that people use nowadays is mobile technology. It has developed a new atmosphere among students and instructors in order to improve today's access to knowledge. After considering it, we realised the importance of this promising environment that the Android platform has made possible. on how faculty members connected to the school, parents, and students gathered data. The proposed system will improve college information storage and retrieval accessibility, simplicity, and interaction.

INTRODUCTION
The software's goal is to create an app exclusively for colleges so that students and parents can readily access information on college policies, announcements, faculty information, document sharing, and a wide range of other topics while also learning more about the institution as a whole. There is also an area where you may find vital materials, like timetables, PDF books, and past test papers. It is simple to obtain under the faculty area if a student needs contact information for a teacher or a parent needs to get in touch with the department teacher that their child is enrolled in.

Without the burden of joining another social media network, this type of app system will offer parents a simple, quick method to stay current on educational information.

Students who are interested in attending the college can use the app as a digital prospectus to learn more about the institution and to view images of the campus life in the gallery part.

LITERATURE SURVEY
The current system often uses manual and paper-based procedures for managing a variety of college-related tasks, such as communicating, scheduling exams, managing timetables, keeping track of attendance, and managing timetables and timetables.

Manual procedures: Relying on manual procedures makes the process time-consuming and error-prone. Numerous physical records must be kept, which are challenging to manage and update.

Lack of Accessibility: Because the current system depends so largely on physical papers, it is not accessible. It limits stakeholders' access to information through distant means, decreasing the effectiveness of communication and decision-making.
Limited Communication: There is little communication among students, professors, and administration, and it frequently involves physical contact. Delays in addressing inquiries, gaining clearances, and sharing crucial information might result from this.

Ineffective Data Analysis: In the current system, it takes a lot of time and effort to analyse data in order to produce reports, spot patterns, and make data-driven choices.

The limitations of the present approach are overcome by suggesting a new one utilising Android Studio, a popular programming environment for creating Android applications.

Mobile Application: To enable stakeholders to access and control different features using their smartphones or tablets, the proposed system calls for creating a mobile application using Android Studio.

Efficiency and automation. Numerous administrative processes, including scheduling exams, managing timetables, tracking attendance, and managing student information are automated by the new system. With less physical labour required, fewer mistakes are made, and efficiency as a whole is increased.

Real-time communication capabilities are incorporated into the proposed system's mobile application, including chat, alerts, and announcements. This makes it easier for students, staff, and administration to communicate instantly, which enhances responsiveness and collaboration:

Data Analytics: The new system has powerful data analytics features that let users produce reports, visualise data, and make choices based on current information. This enables administrators to monitor performance, spot opportunities for growth, and use data-driven tactics.

Better Accessibility. The suggested solution provides improved accessibility by allowing users to interact, submit assignments, monitor timetables, and access information via their Android smartphones from any location at any time.

A feasibility study is a crucial stage in assessing a project's viability and likelihood of success. If the College Management Project uses Android Studio, doing a feasibility study can assist evaluate a variety of factors, including technological, financial, and operational viability. An outline of the project's feasibility study is provided in this note.

The proposed project's technical viability is assessed using the resources and technology currently in use. The proposed project's economic viability and potential for a positive return on investment are assessed. Operational feasibility assesses how well the proposed system can be incorporated into current workflows and how well it complies with the operational procedures of the college.

ARCHITECTURE

ACTIVITY DIAGRAM
created to provide a platform for students to connect with and obtain pertinent information while streamlining and improving the handling of numerous administrative chores inside a college. The programme acts as a complete tool for the college's administration and streamlines data management and communication with students.

A centralised dashboard is made available to the college administration to administer and track many elements of the organisation. Managing student records, staff data, course information, and academic calendars are some of the key functions.

Student attendance, grades, and disciplinary history may all be updated and maintained by administrators. Administrators may also create reports and analytics on student performance, enrolment, and other pertinent variables using the dashboard.

admin manages activities like notice, documents, add faculty, gallery photos for college events, infrastructure, and hotels, and also delete a faculty.

the student is the only one who can access the database that contains all the uploaded data or documents; they cannot remove it, however, they can see and download some of the material.

RESULT

The Android application offered by The College Management Project is user-friendly and effective, meeting the requirements of both college administrators and students. The initiative intends to streamlining operations, create transparency, and promote academic success within the college community by automating administrative procedures, strengthening communication channels, and promoting student participation.

FUTURE ENHANCEMENT

There are many methods to improve the functionality, usability, and efficiency of the Android-based College Management Project.

Mobile Application Optimisation: Make sure the app is optimised so it runs smoothly on a variety of Android devices with differing screen sizes, resolutions, and hardware requirements. This will improve user experience and guarantee compatibility with a variety of devices.

Integration with Learning Management Systems: To enable seamless integration of course content, assignments, quizzes, and discussion forums, integrate the college management project with well-known Learning Management Systems (LMS). With the help of this integration, staff members and students will have access to a comprehensive platform for both administrative work and academic activity.

Resource Booking System: The project should have a resource booking system that enables users to reserve resources like classrooms, labs, and sporting venues. This will simplify the process of allocating resources, avoid disagreements, and enhance resource utilisation in general.

Adding a module for gathering student comments and conducting surveys is a good idea. The college will be able to gain insightful information in this way about a variety of topics, including course assessments, teacher performance, campus amenities, and overall student happiness. The feedback section can support initiatives for ongoing improvement.

Integration with External Systems: Consider methods to connect the college management project to other programmes or services, such as payment processors, library administration software, or student information systems. This will improve data sharing across various systems and streamline interoperability.
Added Security Protocols: Implement extra security protocols like two-factor authentication, data encryption, and role-based access control to strengthen the project's security safeguards. Sensitive student and institutional data will be protected in this way.

There can only be 100 connections active at once, and notifications can only be issued via the firebase console. Firebase Realtime's monthly data download limit of 10 GB can be increased.

CONCLUSION

The suggested application undoubtedly assists students, parents, and teaching staff in keeping students informed of college-related information. It is a portable software that you can use at any time to access contact information, critical papers, and notices all in one location. This will remove the trouble of looking for vital college-related items without losing them. It features an intuitive user interface.

If we strategically use the app and maintain managing the data at the firebase server on a weekly basis by deleting superfluous garbage photos, upgrading the firebase server plan can help the app expand even more. The apps are created in a way that allows for future changes, such timetable or attendance tracking, to be readily deployed without compromising the integrity of the existing code.

A complete and effective solution for controlling all parts of a college or educational institution is the College Management Project based on Android. The project offers an integrated platform for seamless communication, information management, and academic operations, addressing the demands of administrators, teachers, and students. The project offers a number of important features and advantages by utilising the power of Android technology. Through a user-friendly interface, administrators may effectively handle student registration, faculty data, course scheduling, and other administrative responsibilities. The system facilitates timely announcements, alerts, and updates while promoting effective communication between administrators, instructors, and students.

The project offers faculty members tools for organising course materials, assignments, and assessments. It streamlines the procedures for keeping track of attendance, producing reports, and getting in touch with students. Additionally, the project features a grade-management system that enables instructors to quickly input and compute grades, assuring accurate and timely evaluations. Additionally, students gain from the initiative since it gives them access to crucial academic data such as class schedules, homework, and grades. Through the system, students may communicate with professors, turn in assignments, and monitor their development over the course of the academic year. The project also integrates a student portal for functions including event registration, fee payment, and resource access.
