E Grampanchayat

Prof.Vidya Shinde, Harshal Sarwade, Shubham Kale, Harshal Shinde, Shubham Shinde

Abstract

E-Gram Panchayat leverages digital technologies to streamline and improve the efficiency of administrative processes within rural local self-government bodies. It enables the automation of various tasks and reduces paperwork. The use of technology ensures transparency in decision- making and resource allocation. Citizens can access information related to Panchayat activities, budgets, and projects online, fostering greater accountability among local representatives. E-Gram Panchayat platforms often include citizen-centric services, allowing villagers to participate in governance actively. This includes online grievance redressal systems and public feedback mechanisms. It enhances the delivery of essential public services such as birth and death certificates, land records, and social welfare schemes. These services become more accessible to rural residents through online portals

Introduction

In an era characterized by technological advancements and digital empowerment, the E-Gram Panchayat website serves as adynamic and innovative platform that revolutionizes the way local governance functions. E-Gram Panchayat, also known as the "Electronic Gram Panchayat" is a pioneering concept that aims to bring government services, information, and decision-making processes to the fingertips of rural citizens and administrative officials. An "E-Gram Panchayat" website is an onlineplatform designed to facilitate the functioning of Gram Panchayats in India or other similar local self-government bodies in different regions. Gram Panchayats are the lowest tier of the Panchayati Raj system in India and play a crucial role in rural governance. Over the years, the role of Gram Panchayats has evolved, and they have gained significant importance in the context of rural development and governance in India. They play a crucial role in the implementation of various government schemes and programs aimed at uplifting the rural population and improving their quality of life.
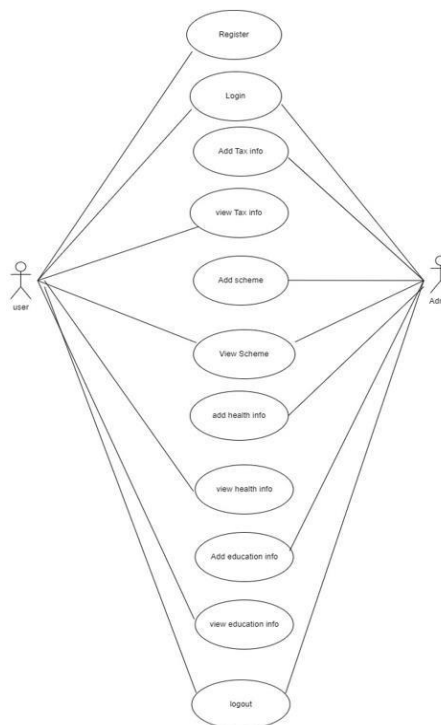

Methodology

The comprehensive methodology for implementing e-Gram Panchayat begins with a meticulous needs assessment, scrutinizing the Gram Panchayat's existing processes and challenges. Stakeholder engagement follows, involving Panchayat members, government officials, and the

local community to gather diverse perspectives. Clear objectives are then defined, emphasizing specific improvements in citizen services, financial management, and communication. The technology infrastructure is rigorously evaluated and upgraded as needed, with a focus on scalability and alignment with local contexts. Concurrently, capacity- building initiatives are undertaken, providing training programs to enhance digital literacy among Panchayat members and the community. Ensuring legal and regulatory compliance, especially in privacy and security, is paramount. The development of a comprehensive information system comes next, integrating modules for citizen services, financial management, and communication. An accessible citizen services portal is implemented, designed to be user-friendly and inclusive. A robust financial management system is integrated, ensuring transparent fund allocation and accounting. Monitoring and evaluation mechanisms are established to gauge the system's impact, with regular assessments guiding data-driven improvements. Feedback loops are institutionalized for continuous refinement. The scalability and sustainability of the system are carefully planned, accommodating future growth.

Flow chart

Existing System

An E-grampanchayat system is a comprehensive digital infrastructure designed for efficient rural governance at the gram panchayat level. This system incorporates online record keeping, including digitized land records and a centralized citizen database, facilitating easy access to information. Financial management tools automate budgeting, accounting, and tax collection for enhanced transparency. Citizen services are streamlined through online applications and real-time status tracking, while communication tools provide automated notifications and avenues for filing complaints. Administrative workflows, including meeting management and process automation, contribute to increased efficiency. The system also addresses infrastructure development with project management and resource allocation features. Robust security measures ensure data integrity, and access control is implemented based on user roles. Ongoing training programs and technical support are integral components, ensuring effective utilization and maintenance of the E- grampanchayat system, ultimately aiming to improve governance and service delivery in rural areas.

Literature Review

From the paper [1], Prof. S. D. Dhage and Prof. G. A. Ghone proposed his project is aimed at the developing an E-Gram Panchayat management system.The System(GMS) is an online based application that can be accessed throughout the internet.This System may be used for monitoring gram- panchayat activities. Admin as well as body member's logging, it may also access and public can search provided   information   regarding grampanchayat at any time. The Information about Schemes published by government or any other activities and billing record will be updated by body members and the secure data maintained by only administrator. This System (GMS) is being developed for Kalawade Grampan- chayat to maintain and facilitate easy access to information. For this user don't need to be registered. It is necessary for

the Grama Panchayat to keep track of its day-to-day activities & records for e.g. Funds Management For Water And Sanitation Facilities In A Village, Ensuring Safety Of Drinking Water In Gram Panchayat, Road Management, Street Light Management, Heir And Death Certificate Management, Funds Report Generation.

From the paper [2],author has proposed an the technology generation everyone use internet on mobile as well as computer. Now- a-days in rural area farmers and workers work in farm. This people daily working in farm for earn money that time this people or worker want any document regarding some certificate(Dakhala) for any purpose from gram panchayat. That time these people taking leave from work and and visiting in gram panchayat for the document.It means that day working payment loss. These purpose we are invent one software and android application. This is IoT base android application connecting with web application. In that one end user(Local People) using android application for the sending or applying online documents from Gram panchayat and also viewing various scheme list who's candidate appearing for that and voting list and various committee and history of that village and current affairs etc. These all the content user watching or viewing all him/her device. When any user wants any document then firstly user fill the format of application and submit. Then submitted application goes to the website admin panel. When application form comes in admin notification that time admin watching user application form then admin copy aadhar number from application form and searching any remaining balance is available or not (home tax/ water tax/ other tax).

The paper [3] ,this project is aimed at the developing an E-Gram Panchayat Management System(EGPMS). EGPMS is an online based application that can be accessed throughout the internet. This System may be used for monitoring gram panchayat activities. Admin as well as body member's logging, it may also access and public can search provided information regarding gram panchayat at any time. The Information about Schemes published by government or any other

activities and billing record will be updated by body members and the secure data maintained by only administrator.EGPMS is being developed for maintain and facilitate easy access to information. For this user don't need to be registered. It is user friendly website, only admin has authority to give access or choose login members. EGPMS is an online based application that aims to provide information keep the Records and Documents like birth certifcates, death certificates, residential certificates, 7/12 certificates. Any user can access the data and download some information from database and only body members have authority to upload the data.

In the paper [4], This project is aimed at the developing an E-Gram Panchayat Management System (EGPMS). EGPMS is an online based application that can be accessed throughout the internet. This System may be used for monitoring gram panchayat activities. Admin as well as body member's logging, it may also access and public can search provided information regarding gram panchayat at any time. The Information about Schemes published by government or any other activities and billing record will be updated by body members and the secure data maintained by only administrator. EGPMS is being developed for maintain and facilitate easy access to information. For this user don't need to be registered. It is user friendly website, only admin has authority to give access or choose login members. EGPMS is an online based application that aims to provide information keep the Records and Documents like birth certificates, death certificates, residential certificates, 7/12 certificates. Any user can access the data and download some information from database and only body members have authority to upload the data

The focus of the paper [5], A Village Panchayat is a local governing body for administration in rural parts of India. E- governance is an electronic means that has applications which acts as a mode for interactions between government and citizens. Many developing country governments face these problems of inefficiency, internal and external communications breakdowns, poor service delivery, and corruption. There are many projects that have aimed of developing an E Gram Panchayat system. There is a lot of data in a village that can be analyzed digitally using data mining techniques which can provide us with valuable insights of the current situation of the village and can help to take decisions based on the need of the hour. Data sets containing population count, garbage consumption, water consumption can be analyzed to properly monitor the use and wastage of resources and waste management. Implementing a centralized system which will be online to be accessed via internet which will be safe & secure, having single version of updated data with multiple access that can be accessed anytime anywhere.

Conclusion

Finally, the adoption of e-Gram Panchayat signifies a revolutionary move in the direction of promoting effective and inclusive local government. The detailed process described includes several important elements, such as stakeholder engagement, technology infrastructure, capacity building, and needs assessment. The strategy guarantees a strong and safe digital platform by placing a high priority on defined goals and regulatory compliance. Transparency and accessibility are improved when financial management, communication, and citizen services are all integrated into one comprehensive information system.

Continuous improvement is facilitated by the focus on monitoring, assessment, and feedback systems, and the system is prepared for future development through scalability and sustainability planning. Engaging the community actively fosters a sense of ownership and responsibility among residents while also ensuring the success of digital efforts.
