Abstract –The agricultural industry is quite significant in India. Unfortunately, many farmers do not have enough money to purchase modern machinery, including tractors, harvesters, and other farming tools. Therefore, this project is aimed at providing a means for these farmers to rent agricultural equipment easily via a mobile application or through the Web-Based platform – "Mobile Based Farm Equipment Rental Platform".

Through this system, the user can view the equipment that is available for rent, along with the rental rate, and request the equipment they need for their required time frame. The owner of the equipment will be able to list their equipment for rent using this platform and it will help lower the cost of farming for farmers, while at the same time increase the amount of equipment that is used by farmers.

This system is intended to give farmers the easiest possible access to farming equipment; to help reduce the financial burden of purchasing this type of equipment; and to help increase agricultural productivity using a very simple digital solution.

Key Words: Agriculture, Farm Equipment Rental, Mobile Application, Digital Farming, Agriculture , Machinery, Rental Management System, Farmers Platform

1. INTRODUCTION -

Farming is the backbone of the Indian economy and agriculture impacts many people's livelihoods as they rely on it for their daily sustenance. In today's world, mechanical implements and machinery — such as tractors, planters, and combines — make it easier and faster for farmers to do their jobs, allowing them to

reduce the time spent on physical tasks, while increasing their production capacity. However, because of the high costs associated with purchasing these types of equipment, many small and medium-sized farmers simply can't afford to purchase it without going into significant debt by obtaining various financing options. As a result many of them continue to rely on traditional farming methods or on borrowed equipment from friends

or acquaintances, which often results in missed deadlines for planting and harvesting their crops. To address the problem created by high costs of farming machinery, A Mobile Application Based Farm Equipment Rental Platform could be developed that will allow farmers to quickly and easily rent agricultural machinery as needed through a mobile or internet connection. At any time, a farmer can log into the platform and search for available equipment; view the rental fee for the equipment they would like to use; and then reserve that equipment for a specific time frame. In addition, owners of farm equipment can also sign up with the platform and list the types of equipment they own so that they can rent out their equipment to other farmers for additional income.

2. Body of Paper

• Accessible Farm Machinery

This project seeks to allow farmers to access agricultural machinery easily by allowing them to locate and rent it through a mobile application. To reduce the cost for farmers Many farmers cannot afford to buy expensive machines. This system allows them to rent equipment instead of purchasing it.

• Affordability for Agriculture

Some farmers are unable to afford expensive equipment for their farms; therefore, this online system will provide these farmers with another way (not just through purchase) to acquire the necessary tools needed to grow their crops or livestock.

• Time-saving

Farmers can easily determine what equipment (all the tools they need) is available for rent and the cost, as well as make a booking (or rental agreement) without having to travel around town visiting multiple vendor locations..

• Increased Usage of Equipment

This project allows agricultural equipment share rates to increase due to share owners renting out/using their machinery, which ultimately leads to increased use of agricultural equipment.

• Supporting Digital Agriculture

The use of digital technology is becoming more widespread within the agriculture industry; therefore, the use of this software will result in greater efficiency and effectiveness of farming.

Fig -1: Fill the Information

Fig-2: Get your booking

Fig-3 : Dataflow Diagram

Start:

This is the first step in using the farm equipment rental platform.

Open Farm Equipment Rental Platform:

The user opens the mobile application or website of the **Farm Equipment Rental Platform**. This platform allows farmers to find and rent agricultural equipment easily.

UserRegistration/Login:

In this step, the farmer or equipment owner registers on the platform by entering details such as name, phone number, and password. If the user already has an account, they can simply log in

BrowseFarmEquipment:

After logging in, the farmer can view the list of available farm equipment such as tractors, harvesters, sprayers, rotavators, and other machines. The user can also check equipment details, rental price, and availability.

SelectEquipment:

In this step, the farmer selects the required equipment for farming work. The user can choose the machine according to their need and the duration for which they want to rent it.

BookingConfirmation:

The equipment owner receives the request and confirms the booking if the equipment is available. After confirmation, the farmer can rent and use the equipment.

PaymentProcess:

The farmer completes the payment process using the available payment options on the platform.

UseEquipment:

After successful booking and payment, the farmer uses the equipment for the required farming work.

ReturnEquipment:

Once the work is completed, the farmer returns the equipment to the owner as per the agreed time.

End:

This is the final step where the rental process is completed successfully, and the platform records the transaction..

Fig-4:Pie Chart

Tractors–39.2%(DarkBlue)

Within the overall machinery rental sector, tractors are expected to be the leading source of usage. With assistance from tractors in carrying out various tasks associated with farming (e.g., plowing), transporting items, and preparing fields for growing, it is easy to see why so many farmers will rent a tractor rather than purchase one outright.

Harvesters–25%(Teal)

Harvesters are used during the harvesting season to collect crops quickly and efficiently. Renting harvesters helps farmers complete harvesting work faster without investing a large amount of money.

Sprayers–12%(Green)

Sprayers are used for spraying fertilizers, pesticides, and chemicals on crops. Renting sprayers helps farmers maintain crop health without buying the equipment.

OtherEquipment–8%(LightGreen)

This category includes other agricultural machines such as seed drills, rotavators, cultivators, and ploughs. Farmers rent these machines whenever required for different farming tasks.

1. CONCLUSIONS

The Mobile Based Farm Equipment Rental Platform is a useful solution for farmers who cannot afford to purchase expensive agricultural machinery. This system provides an easy and convenient way for farmers to rent farming equipment whenever they need it. By using this platform, farmers can save money, reduce manual work, and complete their farming activities more efficiently. The platform also creates an opportunity for equipment owners to earn additional income by renting their machines to other farmers. This helps in better utilization of agricultural equipment that might otherwise remain unused for long periods. With the help of mobile technology, the system connects farmers and equipment owners in a simple and organized way. It reduces the difficulty of finding equipment and makes the rental process faster and more transparent. Overall, the Mobile Based Farm Equipment Rental Platform supports the growth of digital agriculture and helps improve farming productivity. It provides a practical and cost-effective solution that can benefit both farmers and equipment owners while contributing to the development of the agricultural sector.

4. ACKNOWLEDGEMENT

I would like to express my sincere gratitude to all those who helped and supported me in completing this project titled **“Mobile Based Farm Equipment Rental Platform.”**

First of all, I would like to thank my project guide and teachers for their valuable guidance, encouragement, and continuous support throughout the development of this project. Their suggestions and advice helped me to complete this work successfully.

I am also thankful to my college for providing the necessary facilities and resources required to complete this project. The knowledge and skills I gained during my course helped me a lot while developing this project.

I would also like to express my heartfelt thanks to my parents and friends for their motivation, support, and encouragement during the completion of this project.

Finally, I thank everyone who directly or indirectly helped me in completing this project successfully.
