**Abstract** - The present investigation entitled study of "Bee flora of Kalaburagi region" was carried out on the honey bees were recorded on different agricultural and horticultural crops during the season October 2018 to September 2019. It was observed that the Bee flora of Kalaburagi region consists of mostly fruits, vegetables crops ,plantations, medicinal and Aromatic, ornamental plants .It was revealed that they are 230 plants species as nectar and pollen yielding bee flora of honey bees .They constituted 16 vegetables crops, 12 field crops, 15 fruits,6 Plantations ,49 ornamental plants,2 herbs, 8 oilseeds,78 trees, weeds 109,medicinal and aromatic plants 45,pulses 2 .Here the table 1 consists of bee flora of kalaburagi region and further it was divided into family wise distribution of bee flora and then it follows by floral calendar with bandings and the final table is with percentage abundance of bee flora which shows the highest number of bee flora in the month of November with maximum 59.13% on the basis of information of flowering period ,circular bee flora calendar was developed which can be used as a ready reckoner for the farmers. It revealed the presence of some of the plants which acted as a food source of honey throughout the year.

**Key Words:** Honey bees, Bee flora, family wise distribution, floral calendar and percentage abundance.

### 1.INTRODUCTION

Honey bees are the marvelous insects known to mankind since to pre historic times. Perhaps the bees are the only insects which are more beneficial mankind as they produce honey, wax, and venom and also involved in increasing crop production through pollination. Honey bees are popularly known as "Angels of agriculture ",since they are the instrumental in increasing the productivity of crops nectar and pollen .The exclusive source of nutrition to the honey bees constitutes the raw materials to the bee keeping industry. Honey bees are the most important and superior pollinator of the natural ecosystem, as they store pollen and nectar for the future purposes to fulfill their requirement .Honey bees pollinates wide variety of flowers in mutuality or right from cultivated to wild species and ornamental crops. Scientifically, honey bees comprise mainly 4

species namely Apis- Dorsata, Apis-florae, Apis-cerena and Apis- mellifera. In the area under the investigation of kalaburgi region only 3 species are found that are Apis -florae , Apis- dorsata and Apis –cerena but Apis- Cerena are reared one in the agriculture university of Kalaburagi region. Including the non Apis species also found in the present study some of them are tetragonal irridipenis ,carpenter bee, xylocopa ,blue banded bee, leaf cutter bee these, were identified by our experts of agriculture department of kalaburgi region. These apis and non-apis species commonly known as honey bees as collect the nectar and pollen. Nectar which is a sweet liquid, carbohydrate rich source of energy from floral and extra floral nectar rise present in flower and leaves, which is the raw material for honey and pollen as a protein source. That's why farmers should have some idea about the availability of food in the natural form .The plants that yield nectar and pollen are collectively referred as bee flora for the promotion of bee keeping to be done in kalaburgi region. It is compulsory to study the bee flora, as we can 't harvest these species due to their ferocious nature that is Apis –Dorsata and Apis- Florae , but Cerena is reared in kalaburgi region , this proper study of bee flora in some ready reckoner forms and helps the farmers for the growth of flora .

Development of the family wise distribution bee floral calendar on the basis of availability of bee flora blooming period is the basic tool for the farmers of a particular area, which work as a decision in making tool for them as according to the availability of flora they can decide if the supply of pollen substitute or nectar supplement and the migration of the species will be not required .we surveyed the area, enlisted the bee flora and categorized them on the basis of availability over the months. Circular bee calendar was prepared and family categorization was also done and made a ready reckoner for the farmers with percentage abundance of the bee flora of kalaburgi region ,which includes approximate duration of the blooming period of existing honey and pollen sources in an area . As we need good food sources and water facility for both Apis and non- apis species for our survival as honey bees and flowering plants have evolved together over Millions of years . Without

flowers, we would have no bees and without bees we could not have flowers as they are inter-dependent.

## 2. Methods and Materials :

### 2.1 Study Area

The present study was conducted during the month of October 2018 to September 2019 at kalaburagi region of north Karnataka, India as kalaburagi region is a semi-arid region. The observations were made during 3 consecutive seasons winter, summer and rainy seasons. The study of bee flora was done for one year. Kalaburagi district has a precambium system of non-fossiliferous sandstones, lime stones and shale's extending along the central part of the district. Kalaburagi is one of the north eastern districts of Karnataka lies between  $76^{\circ} 04'$  and  $77^{\circ} 04'$  longitude and  $17^{\circ} 46'$  and  $18^{\circ} 12'$  latitude. The total area of the district is 16242.4 Sq km. This is the second largest district in Karnataka state. The district is situated within the Deccan plateau at an elevation of 445m MSL. The Plateau has a few outcrop with a mean elevation of 445 MSL. The deep black soil is rich in clay with a moisture of sandy loam in kalaburagi. The soil pH is neutral (7-7.5) the soil is made up of 10% coarse sand, 20% of fine sand 70% clay and silt. The mean minimum varies from  $7^{\circ}\text{C}$  to  $24^{\circ}\text{C}$  and mean maximum of  $24^{\circ}\text{C}$  to  $42^{\circ}\text{C}$  may be the hottest month and the maximum temperature is recorded as  $47^{\circ}\text{C}$  and December – January, are the coldest months and minimum temperature was recorded  $15^{\circ}\text{C}$ . The dry months spreads for period of seven months in a year. The overall rain fall of kalaburagi varies from all other districts of Karnataka. Here the mark increase in the rainfall and number of rainy day from November – April. This was considered as a good rainfall in the year 2019 June – august.

**Fig -1:** Map showing the study sites in geographically distinct areas in Northern Karnataka Kalaburagi

### 2.2. Methodology:

Each study visits served as pseudo replicates for the site and all observations were between in the morning hours 8:30 - 5:45 to evening hours in the three consecutive seasons winter, summer and rainy. Honeybee foraging plants were determined with visit of honey bee workers on its flowers for 5-10 minutes. The observations on nectar and pollen source was based on the activities performed by honey bees on different flowers, i.e. honey bees with their activity of extending their proboscis into the flowers were considered as nectar source and bees carrying pollen on their hind legs were determined as pollen source of plants (Mbah and Amao, 2004; Bista and Shivakoti, 2000-2001) and those unknown plants were identified with the experts from agriculture college of kalaburagi, botany department of kalaburagi. Plants were categorized either rich in pollen (p1,p2) or in nectar (N1, N2) or combination of two indifferent levels (partap 1997).

#### 2.4. Identification of bee flora:

For identification of prevailing bee flora resources in nature a keen visual observation was made on flowers and sometimes the binoculars were used , monthly visits to study sites on flowers at their blooming period to observe the activities of bees for a period of 5 to 10 minutes flowers, being visited at least by 3 to 4 bees within stipulated time were considered as bee flora base on frequency visitation of worker bee to a flower. For age value establish as low and high nectar and pollen rich plant.

#### 2.5 Family wise distribution:

Family wise distribution of bee flora was also done by family names and how much number of species in each family belongs / scientific names.

#### 2.6: Preparation of Bee flora Calendar:

During the survey on the basis of flowering of periods of the identified bee flora complete record was maintained and used for the preparation of bee flora calendar .Here the calendar was prepared according to 3 consecutive seasons and were arranged to the range of blooming period of bee flora. Here the flora calendar of kalaburgi region from October 2018- sep 2019 was done by binding colour and plant species month wise all the bee flora were included.

**TABLE 4: Floral Calendar Of Kalaburgi Region Oct 2018 - Sep 2019**

Sl.No	Plant species	Oct	Nov	Dec	Jan	Feb	Mar	April	May	June	July	Aug	Sept
1	<i>Adhatoda zeylanica</i>

82	<i>Trichosanthes tricuspidata</i>											
83	<i>Cyperus compressus</i>											
84	<i>Acalypha indica</i>											
85	<i>Breynia Vitis –idaea</i>											
86	<i>croton bonplandianus</i>											
87	<i>Euphorbia antiquorum</i>											
88	<i>Jatropha gandulifera</i>											
89	<i>Kiraganelia reticulata</i>											
90	<i>phyllanthus emblica</i>											
91	<i>Ricinus communis</i>											
92	<i>Securinega leucopyrus</i>											
93	<i>Bauhinia malabarica</i>											
94	<i>C.auriculata</i>											
95	<i>Delonix elata</i>											
96	<i>Hardwickia binate</i>											
97	<i>Pterolobium hexapetalum</i>											
98	<i>Tamarindus indica</i>											

Percentage abundance of bee flora for a month =  $\frac{\text{Number of bee flora species in particular month}}{\text{Total number of bee flora species}} \times 100$

It was observed that percentage abundance of bee flora were highest with maximum 59.13 % during the month of November 2018 followed by December 55.217%, October 49.13%, September 43.04% and then

January 32.17%, august 26.95%, February 25.65%, July 14.78%, April 13.47%, June 11.73% and lastly the month of May 11.30%.

**Table 5:Floral Calendar Of Percent Abundance Of Bee Flora of Kalaburgi Region From Oct 2018 - Sep 2019**

### 3. Results and discussion :

The areaof study under the agro crops and covered with plantations.Inorder to develop a comprehensive picture of the scenario of bee pollinators, field extensive and intensive field observationare required , therefore bee flora and floral calendarwas documented under the field conditions in kalaburagi region .The field observationswere recordedduring October 2018toSeptember 2019. The flora of kalaburagi region were categorized to 11 groups they are plantations ,vegetables, weeds, oil seeds , trees, ornamental plants, medicinal and aromatic plants, pulses, herbs,fruits,field crops.The result revealed that in kalaburagi region 230 plants species wereuseful to honeybees outof which vegetables 16 ,fruits 15,oil seed 8 ,pulses

2,ornamental 49,medicinaland aromatic 78, herbs 2,plantations 6 ,weeds 109,trees78, field crops 12.There were respectively documented and foundin the study area . In the study area major plants were recorded in the month of November Andrographics paniculata,justice Diffusa ,lepiorogathascristata,trianthema, Aervalanata, Annona Reticulate , Digera muriculata ,coria drum,sativa, albiumrespectively and followed by the month of December. Here the nectar collection wasmore than the pollen. These plants are followed by month wise respectively .The following plants of the area having good value , so honey bees visited these plants extensively for honey production .

### Conclusion:

The present finding revealed that in kalaburagi region 230 plant species were useful to honey bees out of which vegetables 16, fruits 15, plantation 6, weeds 109, trees 78, medicinal and aromatic 45, ornamental plants 49, oil seeds 8, pulses 2, field 12, herbs 2 respectively documented and found in the study area. The identified flora was further grouped into pollen, nectar both pollen nectar yielding plants. Honey bee plants have a special symbiotic relationship. Bee flora is important for establishing bee keeping industry. The awareness to maintain the existing bee flora and multiplication of plant species is important for its sustainability. Plant types and their flowering duration differ from one place to other due to variation in topography. Climate conditions frequent and moderate visit on flower clear that honey bees preferred all the plants as a major food source. From the above discussion, it can be concluded that kalaburagi region can be considered appropriate area for initiation to improve the livelihood for the farmers about natural food availability in particular month and power to make decision for sustainable bee keeping. As we have a very good bee flora in kalaburagi region so based on available flora, major characteristics of these plant species pollen and nectar availability and flowering duration a bee floral calendar as per the season were developed to consume these floras. Attention must be given to maintain and

multiply the existing flora. These records of bee flora during the study encourages their conservation of honey bees in future as well.

As honey bees are the essential of crop ecosystem by pollinating wide range of crops.

### Acknowledgements:

My guide my mentor and the lovable and caring person, as without his help the research will not be completed Prof. Dr. Shankerappa. S. Hatti department of UG and PG studies and research in zoology government college kalaburagi, I am very much thankful to him. My sincere thanks to the Prof. Dr. B.V. Shweta Assistant professor of apiculture department GVK Bengaluru, for her valuable suggestions and support for making my paper. Dr. Raju Teggalisir from agriculture college of kalaburagi for motivating, helping me with his guidance it was most useful to find out the flora of kalaburagi region. I am very much thankful to him and his staff and all the farmers groups of kalaburagi region. Technical support and making my paper more colorful thank my sister-in-law Nazy Sanglikar.
