1. INTRODUCTION

used cost-benefit analysis using accounting systems to measure the financial performance of a website. One layer of complication as indicated by Auger is that payoffs mOnline employment service is a app or website, We are particularly focusing on the house holding like just focus on the household things that if you need a something for the your house ,like penter, designer, electricians ,maid anything so you can find with the help of this app or website and they can create profile and upload their all data and bio about their experience and how much amount that taking

for the building, builder ,painter and interior designer ,architect anybody can create your profile and it will be so simple interface there is no need for the worrying you can't create ,it will so simple like anybody can create whether you are educated or uneducated it will be very user friendly interface and there'll various features to use and definitely I will guide you by advertising but it just simple app to provide you the job for as per your choice of the location the choice of your designer painter If you are looking for a maid, for a someone that are the nearby of your house the you can find with the help of this app or website Suppose if you want interior designer like Gauri Khan so you can also contact to her or him so simple to contact there would not be any problem to deal with anyone the all employees worker painter designer would be verified and their contact number would be so easy to do with that aap.

2. OPERASIONAL AND FINANCIAL SUCCESS

One of the central issues to website management is to measure its performance. Measuring the performance of websites have been urged in various ways and various contexts over the past decade. In various examples, a single item or a collection of items were used to represent website performance. The performance of a website is commonly measured to gauge the extent to which the desired purpose has been fulfilled. Financial performance is at the core of the organizational effectiveness domain. Beyond this core lies operational performance measures that define a broader conceptualisation of organisational performance by focusing on factors that ultimately lead to financial performance.

Managers' perception of the accrued benefits is reflected according to their eCommerce website meeting its objectives. The objectives of the eCommerce websites are to market products/services and maximise profit/shareholder value by allowing transactions online with another party. Giaglis et observed that the most common methods of evaluating information technology investments is by way of established accounting techniques, such as Return on Investment (ROI). Other measures include those that reflect performance in the market, such as market share and market growth.

Website traffic is the bread and butter for a web-based business and effectively running a business on the web would be difficult without paying appropriate attention to its traffic. A traditional storefront would pay a great attention to location because of the traffic it would bring; likewise, website traffic can be measured and increased to meet business needs. Different aspects of website traffic can be measured by monitoring clickstream data on visitor activities using web analytics tools and technology, such as Google Analytics. Such data offer a plethora of metrics from which businesses must carefully choose measures for different purposes. By analysing visitors' clickstream data logs, web analytics tools provide a trail of the user's online activities and reveal the user's browsing and purchasing patterns. Once a trend can be seen, the website can be adjusted to improve the bottom line. For example, a website is not drawing the right people if visitors are leaving immediately upon arrival, for which the content needs to be adjusted. On the other hand, if the website is drawing the wrong crowd, then the marketing strategy may need to be altered.

However, for the purpose of this research, the different aspects of website traffic are captured by the different metrics available to owners who utilise clickstream data. These metrics are critical for assessing website activities and user behaviour. From a business perspective, such metrics may suggest where improvements can be made with regard to design, layout, and navigation issues. Despite the limitations of clickstream data, detailed and concrete data on users' behaviour can be collected to indicate

trends rather than provide definitive data/statistics on website traffic. Indeed, a reasonable measure could be determined by assessing whether the full functionality of a website is being used for its intended purposes.

Because it is a free service that generates detailed statistics about the visits to the website, and because it is a user-friendly application, Google Analytics is commonly used to tell how visitors found the website and how they interact with it. Such tools, however, only provide raw metrics of limited benefit to businesses using them. Ghandour established that raw metrics can be converted into meaningful information that correlate with business objectives.

3. MAIN CONCEPT OF WEBSITE

My main idea is that to make an app or website to create a profile like anybody can create a profile as a work ka as a builder as a designer as architecture as a painter, anybody can create a profile and share the experience and so that a normal person get their work done, that we can go with that app find a builder if need of builder or builder needs a workers, painter or designer then they can find with the help of that app so it is just very helpful for the everyone to get employee, to get a job as per their desired location and work and employers and workers, painters, builders, interior designers, architecture, maid services, electricians to post jobs and get their income and job easily by helping each other.

It's new also because everyone is making app for the employment service like as a LinkedIn is also in the market but it's not like a LinkedIn it's not like to get job if you are educated and have experiences then only, no not at all. It's for the everyone, illiterate people or educated people anyone can make it the worker and normal worker she/he doesn't know she/he doesn't have much knowledge and the certification but you can upload your profile and amount as much you want as much as required in the market for the labour work, what work do just like working and helping for the builders for the anything if they need it and then they can also get from there so,

it would be so simple and helpful ,it's mainly focused on the household things and the maid and beauty of the house to complete everything at any home and to renew house also does the focus on the housing because I believe there should also have the space for the poor worker and needy people who want to work and earn no matter how so they should also have space for the non educated to get hired & work because they are looking for the job eagerly ,with the help of this

They may get anytime and anywhere because, you know about needy worker, they don't have network much that's why they just stay at home and look from their localiality ,whenever anyone need they may contact to give them opportunity to work so it mainly focus on them to get it easily that we don't have knowledge and education but with the help of this app anybody can find them it will be so easy to make it,The Marketing Concept is preoccupied with the idea of satisfying the **needs** of the customer by means of the product as a solution to the customer's problem (**needs**). The Marketing Concept represents the major change in today's company orientation that provides the foundation to achieve competitive advantage.

4. GOAL SETTING

It is good practice to outline strategic goals as part of the business strategy. Goal-setting serves the purpose of establishing a measure for evaluating the current performance of a business. This will not only set priorities, but will keep the business focused and away from distracting activities that drain business resources and accomplish little. Although setting a goal may seem simple and straightforward, it requires the business to engage in strategic planning. While the first step is to transform goals to objectives, the process of strategic planning involves a detailed analysis of internal resources, external forces, and core competencies of the business. The outcome of this process is a specific plan selected and implemented. Finally, evaluation should be undertaken.

In an online environment, these goals involve choices that position the business in the global information

technology market. Goals are a high-level purpose of a website, such as “return a profit”, which can be translated into lower-level objectives. Objectives can include: increase sales, generate leads, build brand awareness, reach new markets, and provide consumers with information on products. These objectives will form the basis for the online activities the business is likely to be involved in. However, the objectives, the related goal, and subsequently the online activities will be refined according to the detailed analysis of the internal resources, external forces, and technology.

6. WEBSITE VALUE CREATION:website their successful physical presence, businesses are investing in setting up websites to sell their goods/services with the possibility of abandoning the physical realm, as trading online is becoming more popular.

Creating a website for such a purpose requires businesses not only to reflect their strategic initiatives, but also to create value for their customers. Such value should result in a competitive advantage that is difficult to imitate and ultimately depends on customer appeal.

In the online environment, however, users are using commercial websites for informational, transactional, and/or services purposes. Hence, businesses can create value when delivering these functions in terms of technology delivery, product delivery, and customer delivery process. Porter described how the internet creates value for businesses by providing a standardised infrastructure, an intuitive browser interface for information access and delivery, bidirectional communication, and ease of connectivity.

Constantinides argued that the 4Ps paradigm is a poor choice in the case of online marketing and suggested a web-marketing mix framework as an alternative. Krishnamurthy suggested a five-step process to deliver value to the user: 1) identify how different consumers perceive value; 2) choose which value element will be delivered; 3) provide the value and state how value is being delivered; 4) help users learn about the nature of the value; and 5) assess how users perceive the value being delivered

5. RESEARCH TOOLS AND TECHNIQUES

There is a range of sorts of research tools each offline and online -- that are employed by several massive businesses and may be offered to tiny and mid-sized businesses. Once these techniques involve folks, researchers use questionnaires administered in written kind or person-to-person, either by personal or interview or progressively online. Questionnaires could also be closed-end or open-ended. The primary kind provides users with decisions to an issue ("excellent," "good," "fair") whereas open-ended surveys solicit spontaneous reactions and capture these as given. Focus teams are a sort of opinion-solicitation however while not a questionnaire; folks act with product, messages, or pictures and discuss them. Observers evaluate what they hear.

7. MODULE DESCRIPTION

- First it's to come up with a login page, if the user is new so they have to register.
- To access the system, users need to first register by entering the basic registration details like name, email- id, mobile no, gender, etc.
- Log in-
- Here users need to follow the login process to access the system.
- If the login credentials are validated by the system, the page will be redirected to a user authentication page where users need to select authentication of the Website
- Main Page Access-
- If the user passes the authentication process, then the page will be redirected to the main page else, it will redirect to the login page.
- Front-End and Back-End Technology-
- Front- End-
- Programming language-
- PYTHON, JAVASCRIPT, HTML.
- Back End-
- PYTHON

- Technologies used-
- MYSQL, CSS(Cascading style Sheet), BOOTSTRAP.
- Type of Application-
- Web Based Application
- IDE used-
- Visual Studio.

8. CONCLUSION: This idea concludes that it just focus on the particular thing for the household it is not like only educated people can make it, it's like anybody can make or create, get the work because he/she knows they don't have the knowledge they don't have a degree but they are doing work as labor anywhere so that they can also get a job from this, anybody can get and live, nowadays the women also are ready to work and if you need them maid or ladies servant if you need to work if you need an electrician so that we can get the help of app because I know the many apps are doing such things but they are just like not focusing on a particular thing but my website is just focusing on a particular thing and growing at large. This is because the revolution in information technology is happening simultaneously with other developments, especially the globalization of the business. The new age of global e-commerce is creating an entirely new economy and that will tremendously change our lives, will reshape the competition in various industries, and alter the economy globally. As companies are gaining high profits, more and more other companies are developing their websites to increase their profits.
